

A PHOTOGRAPH OF FUTURE MISSION

Is it Possible to Photograph the Future as well as the Past?

From my own personal experience I believe it is possible, and that the photograph below is an example of just that.

Mission, in BC, is a pretty and rapidly expanding town built next to the Fraser River. Like so many examples of towns situated near water, Mission intends to develop its waterfront. Options were discussed in 2008 and tentative plans have been drawn up for what will probably become 'Mission Spirit Square'. More information, including story boards, can be found at this URL:

<http://www.mission.ca/Page753.aspx#Drawings>

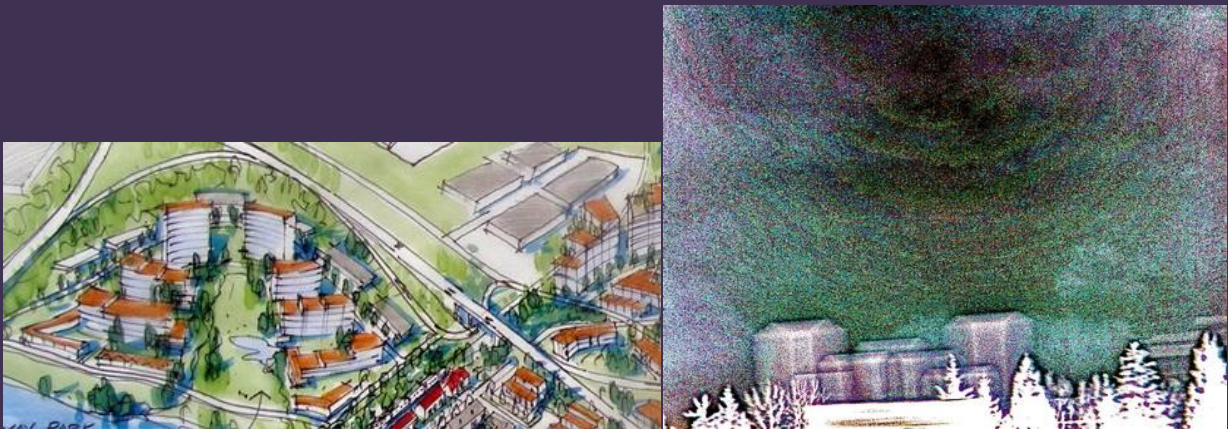

The project is being funded by the Ministry of Community Services *BC Spirit Square Program*. and further information is available from the District of Mission Planning Department at planning@mission.ca or 604-820-3748.

Below on the left is the original photograph that I took while travelling West on the connector road between Mission Bridge and the industrial section of Mission. At first I thought that the black area at the bottom of the photo was a roof, but it's actually a sign posting directions to Abbotsford and Mission.

I have the original dated image on disc, and without searching for it at this moment, I know that the photograph was taken over a year ago. I have only recently discovered that there are plans for a waterfront, and at the time this interdimensional photograph was taken I knew nothing about it at all. As the whole project is still in the future, no building has begun as of September 2009, the time of writing.

When I began to edit the image I flipped it to negative to try and clarify the architectural details of what are very obviously buildings. The negative image of

the building complex with its very distinctive design can be seen below on the right. Please use the magnifying feature to view the images more clearly.

ABOVE LEFT: TENTATIVE PLANS FOR FUTURE MISSION

The buildings seen above left in their planning stage don't exist – yet. The buildings seen above in the negative photograph don't exist yet, either!

The image above left was cropped from the document found at:

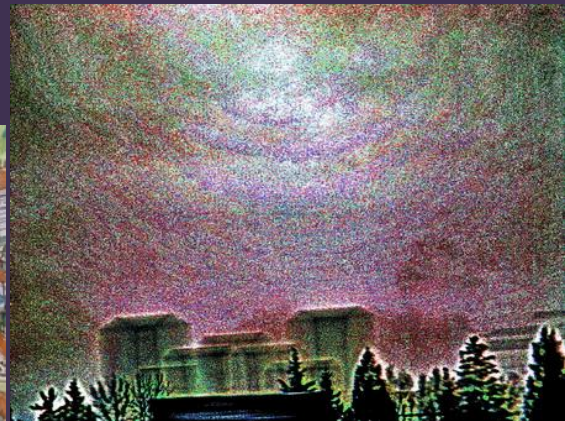

<http://www.mission.ca/AssetFactory.aspx?did=1746>

If you examine the images closely and compare the photos to the available storyboard mock-ups you will see that although the City of Mission's waterfront plans are not exactly the same as the buildings in the psychic image, there are several startling similarities.

If you examine the illustration on the left you will see that the buildings are fanned out in pairs in an unusual way, with the tallest two furthest away at the front and the other two sets decreasing in stature sequentially. They also appear to be set further apart in order of decreasing stature. There may be a smaller building or structure at the front (in front of the two tallest buildings), as there is in my photograph, but if so the roof is not shown in orange on the illustration, as the rest appear to be.

The structures are obviously and remarkably similar in both images. Even more remarkable is the fact that to the right of these large buildings in the illustration is a smaller set. Seen on the far right of the image are some more buildings with orange-colored roofs. Three main roofs are visible, each built in a stepped fashion from low to high. I included this section when I cropped the picture because three stepped roofs are also visible on the far right of the further-edited interdimensional photograph, seen below as a positive image again.

I find the photo to be compelling visual evidence, but of course will have to wait and see if any buildings are ever constructed in this way. Also interesting are the dark shadows seen just behind the buildings in the photo. They can be seen at around the same height as the top of the tallest buildings. I don't believe they represent clouds, but instead look to me more like full-grown trees where none are currently growing behind the structures. This photo could represent a time many years in the future.

I also noted the strange vortex-like formation above the buildings in the sky. Although I think it's connected, I'm not going to deal with it here as it will take us into another subject that although related will only appear confusing placed in the present context.

One other interesting point is that in 2002 a crop circle was discovered in Mission, very unusual in Canada, and I believe practically unheard of within BC at that time, except for the earlier Vanderhoof Circles. The simple circle formation was formed on two sides of the highway (either side of the Mission Bridge) in a corn field. A good report of this anomalous occurrence can be found here:

<http://www.blresearch.com/labreports/mission1.php>

This double formation was found *very* close to where I took the photograph, and the plans for the waterfront feature might also eventually include the land the crop circle formed on. Did perhaps the crop circle in some way enabled the interdimensional photograph; or rather perhaps a special feature of the land (such as a magnetic anomaly) that influenced the positioning of the crop formation in the first place had some influence?

I don't know if this might be so, but it's an interesting theory in keeping with other information regarding (time related) anomalous events and evidence that I've discovered, learned about and studied. I also strongly believe Mission itself is a highly charged area containing 'power-spots' or vortexes and 'interdimensional

windows' that allow or enable many anomalous events to occur, including events of high strangeness and time-related anomalies.

My personal belief is that the project will definitely go ahead, and that one section of the future 'Mission Spirit Square' will look as it does on the photograph seen above.
